Motivation Simply typed  $\lambda$ -calculus in de Bruijn notation The procedure SIMPL The procedure MATCH

イロト イヨト イヨト イヨト

### Motivation

- Higher-Order terms appear frequently in Mathematics, Logic, Automated Reasoning, etc.
- Higher Order Unification (HOU) is a basic operation extensively used in computational systems based on the λ-calculus such as functional programming languages and proof assistants.
- Explicit substitutions are a refinement of the λ-calculus in which the substitution operation is not treated as a meta-operation but as an operation of the calculus itself.

### Simply typed $\lambda$ -calculus in de Bruijn notation

#### Definition

The set  $\Lambda_{dB}(\mathcal{X})$  of untyped  $\lambda$ -terms in de Bruijn notation:

$$a ::= \underline{n} \mid X \mid (a \ b) \mid \lambda.a$$
 where  $n \in \mathbb{N}$  and  $X \in \mathcal{X}$ .

The syntax of simply typed  $\lambda$ -calculus in de Bruijn notation:

Types $A ::= K \mid A \to B$ Contexts $\Gamma ::= nil \mid A.\Gamma$ Terms $a ::= \underline{n} \mid X \mid (a \ b) \mid \lambda_A.a$ where  $n \in \mathbb{N}$  and  $X \in \mathcal{X}$ .

The type of the term *a* is indicated by  $\tau(a)$ .

・ロン ・回と ・ヨン・

### Simply typed $\lambda$ -calculus in de Bruijn notation

#### Definition

1. Every  $\lambda$ -term in  $\beta$ -normal form ( $\beta$ -nf) has the form

$$\lambda_{A_1} \dots \lambda_{A_n} (h \ e_1 \dots e_p)$$

where  $n, p \ge 0$ , h is a variable (or a constant) called its *head* and  $e_1, \ldots, e_p$  are  $\lambda$ -terms in  $\beta$ -nf called its *arguments*.

2. A  $\lambda$ -term in  $\beta$ -nf is *rigid* if its head is a constant or a bound variable. If it is a meta-variable, the term is *flexible*.

・ロト ・ 日 ・ ・ ヨ ・ ・ ヨ ・

#### Simply typed $\lambda$ -calculus in de Bruijn notation

- 3 Let  $a \in \Lambda_{dB}(\mathcal{X})$  be a  $\lambda$ -term in de Bruijn notation of type  $A_1 \rightarrow \ldots \rightarrow A_m \rightarrow B$  with B atomic. The  $\eta$ -long form of a  $\beta$ -nf term a, written a', is inductively defined as follows:
  - if  $a = \lambda_A . b$  then  $a' = \lambda_A . b'$ .
  - if  $a = (\underline{n} \ b_1 \dots b_q)$  then  $a' = \lambda_{A_1} \dots \lambda_{A_m} . (\underline{n + m} \ c_1 \dots c_q \ \underline{m}' \dots \underline{1}')$ , where  $c_j \ (1 \le j \le q)$ is the  $\eta$ -long form of the normal form of  $U_0^{m+1}(b_j)$ .
  - if  $a = (X \ b_1 \dots b_q)$  then  $a' = \lambda_{A_1} \dots \lambda_{A_m} (X \ c_1 \dots c_q \ \underline{\mathbb{m}}' \dots \underline{1}')$ , where  $c_j \ (1 \le j \le q)$  is the  $\eta$ -long form of the normal form of  $U_0^{m+1}(b_j)$ .

▶  $\lambda_A X_A^{A \cdot \Gamma} = \lambda_A \underline{1}_A^{A \cdot \Gamma}$ , where Γ is any context, does not have solutions.

Motivation Simply typed  $\lambda$ -calculus in de Bruijn notation **The procedure SIMPL** The procedure MATCH

### The procedure SIMPL

**INPUT**: A unif. problem P with at least one rigid-rigid equation:

$$\lambda_{A_1} \dots \lambda_{A_r} \cdot (\underline{\mathbf{n}} \ e_1^1 \dots e_{\rho_1}^1) = {}^? \lambda_{A_1} \dots \lambda_{A_r} \cdot (\underline{\mathbf{m}} \ e_1^2 \dots e_{\rho_2}^2) \wedge P'$$

where  $r, p_1, p_2 \ge 0$  and n, m > 0.

WHILE there exists a rigid-rigid equation in P DO

If  $n \neq m$  then stop and report a failure status else let  $p = p_1 = p_2$ and replace the selected equation by the conjunction

$$\lambda_{A_1} \dots \lambda_{A_r} \cdot e_1^1 \stackrel{?}{=} \lambda_{A_1} \dots \lambda_{A_r} \cdot e_1^2 \wedge \dots \wedge \lambda_{A_1} \dots \lambda_{A_r} \cdot e_p^1 \stackrel{?}{=} \lambda_{A_1} \dots \lambda_{A_r} \cdot e_p^2$$

in P and call the result  $\overline{P}$  (the simplified version of P). DONE.

If there exists a flexible-rigid equation in  $\overline{P}$  then return  $\overline{P}$  else stop and report a success status.

# Solved forms

# Definition (DHK00)

A unification problem P is in  $\lambda\sigma$ -solved form if all its meta-variables are of atomic type and it is a conjunction of nontrivial equations of the following forms:

- Solved: X =<sup>?</sup><sub>λσ</sub> a where the meta-variable X does not appear anywhere else in P and a is in Eta-long form. Such an equation is said to be *solved* in P and the variable X is also said to be solved.
- ► Flexible-flexible:  $X[a_1, \dots, a_p, \uparrow^n] =^?_{\lambda\sigma} Y[b_1, \dots, b_q, \uparrow^m]$ , where  $X[a_1, \dots, a_p, \uparrow^n]$  and  $Y[b_1, \dots, b_q, \uparrow^m]$  are **Eta**-long terms and the equation is not solved.

# The procedure $MATCH_{\lambda\sigma}$

### Definition

Let X/a be a substitution generated in the pure  $\lambda$ -calculus by Huet's algorithm. We say that the equation  $Y = \frac{?}{\xi} b$  corresponds (or is associated) to the substitution X/a if X and Y are two meta-variables of the same type and the terms a and b have the same headings, where  $\xi \in \{\lambda\sigma, \lambda s_e\}$ .

The  $\lambda s_e$ -grammar and rules  $\lambda s_e$ -unification rules SIMPL $_{\lambda s_e}$ MATCH $_{\lambda s_e}$ The Main Procedure

# The Main Procedure

**INPUT**: A unification system  $P_{\epsilon}$ .

**OUTPUT**: A success or a failure status and in the former case the solutions are the solved equations whose left-hand side corresponds the meta-variables of the initial problem. If the initial problem is non-unifiable the algorithm may not terminate.

- 1. If  $P_q$  contains a rigid-rigid equation then apply SIMPL<sub> $\lambda s_e$ </sub> to it, else if  $P_q$  contains a non-solved flexible-rigid equation then rename it to  $\overline{P_q}$  and go to the next step.
- 2. Apply MATCH<sub> $\lambda s_e$ </sub> to  $\overline{P_q}$  and let  $P_{q1} \vee \ldots \vee P_{qr}$  be the resulting unification problem.
- 3. If the current unification problem contains a unification system not in solved form then select it and go to step 1, else stop and report a success status.

## Translating $\lambda s_e$ -terms into $\lambda \sigma$ -terms

### Definition

The operator  $\mathcal{T}: \Lambda_{\lambda s_e} \to \Lambda_{\lambda \sigma}$  is defined inductively as:

1. 
$$T(X) = X$$
  
2.  $T(\underline{n}) = \underline{1}[\uparrow^{n-1}]$   
3.  $T(a b) = T(a) T(b)$   
4.  $T(\lambda.a) = \lambda.T(a)$   
5.  $T(a\sigma^{i}b) = T(a)[\underline{1.2.}\cdots.\underline{i-1.}T(b)[\uparrow^{i-1}].\uparrow^{i-1}], \text{ where } i \ge 1.$   
6.  $T(\varphi_{k}^{i}(a)) = T(a)[\underline{1.2.}\cdots.\underline{k}.\uparrow^{k+i-1}], \text{ where } k \ge 0 \text{ and } i \ge 1.$   
If  $r = 0$  in the list  $\underline{1.}\cdots.\underline{r}$ , then it is to be interpreted as the empty list. In addition,  $\uparrow^{0} = id$ .

# $\lambda s_e$ -skeleton

### Definition (Ayala & Kamareddine 2001)

Let t be a  $\lambda s_{e}$ -normal term whose root operator is either  $\sigma$  or  $\varphi$ and let X be its leftmost innermost meta-variable. Denote by  $\psi_{i}^{J_{k}}$ the k-th operator following the sequence of operators  $\sigma$  and  $\varphi$ , considering only left arguments of the  $\sigma$  operators, in the innermost outermost ordering. Additionally, if  $\psi_{i_{k}}^{j_{k}}$  corresponds to an operator  $\varphi$  then  $j_k$  and  $i_k$  denote its superscripts and subscripts, respectively, and if  $\psi_{i_k}^{j_k}$  corresponds to an operator  $\sigma$  then  $j_k = 0$ and  $i_k$  denote its superscript. Let  $a_k$  denote the corresponding right argument of the k-th operator if  $\psi_{i_k}^{j_k} = \sigma^{i_k}$  and the empty argument if  $\psi_{i_k}^{j_k} = \varphi_{i_k}^{j_k}$ . The *skeleton* of *t*, written as *sk*(*t*), is  $\psi_{i_1}^{j_p}\ldots\psi_{i_1}^{j_1}(X,a_1,\ldots,a_p).$ イロン イヨン イヨン イヨン

# $\lambda\sigma$ and $\lambda s_e$ correspondence

### Corollary

Let  $P_{\lambda\sigma}$  be a unification problem in the  $\lambda\sigma$ -calculus of explicit substitutions, and  $L(P_{\lambda\sigma})$  its translation to the  $\lambda s_e$ -calculus of explicit substitutions. Then  $P_{\lambda\sigma}$  is unifiable if and only if  $L(P_{\lambda\sigma})$  is unifiable. Moreover, whenever unifiers exists, they are associated.

- In this work we compared the λσ- and the λs<sub>e</sub>-styles of unification.
- To do so, we presented the *unification tree* notation which allows a clear presentation of the Huet's algorithm in de Bruijn notation.
- This notation was applied to unification problems in de Bruijn notation, but it can be applied to λ-terms with names with minor modifications.

・ロト ・ 日 ・ ・ ヨ ・ ・ ヨ ・
## Conclusion

- We compared the classical method of Huet for HOU and the one of Dowek, Hardin and Kirchner for the λσ-calculus.
- We described the counterpart of the procedures SIMPL and MATCH, called SIMPL<sub>λσ</sub> and MATCH<sub>λσ</sub>.
- We concluded that there exists a correspondence between the substitutions generated by Huet's algorithm and the graftings generated by the λσ-HOU algorithm for unification problems which are in the image of the precooking translation.
- This comparison was extended to the  $\lambda s_e$ -HOU algorithm.
